Addendum No. 2

5-8-24

Mississippi Valley State University
Rice-Totten Stadium Turf Replacement
Itta Bena, MS

TO: ALL BIDDERS OF RECORD

This addendum consists of the followings changes to the bid documents:

- Sheets C100-C108 will all need to be replaced as part of the addendum. Each one was modified in some way, so they all need to be replaced. The title sheet and sheet C109 were the only two that did not have changes (See attachments)

- The bid proposal form will need to be replaced because of the changes to the add alternates. (See attached revised Bid Proposal Form)

- Specification *03900 - ShockPad, Drainage Base, Geotextile Fabric, Flat Panel Drain and Recycled Plastic Nailer Board* has been modified to remove the shock pad info in the spec. The new one is *03900 - Drainage Base, Geotextile Fabric, Flat Panel Drain and Recycled Plastic Nailer Board* (See attached)

RFIs (Questions and Answers)

1. The soils report describes removing unsuitable soil and replacing with fill after proof rolling. How do I quantify the amount required? Could a unit price per cubic yard be added to the bid form?
   Answer: Please refer to the Soils Report to see specific boring location(s) identified with heavy clay within the top 3' that will need possible undercutting/suitable backfill. Estimated quantities determination will be the responsibility of the bidder. This project will be bid as a Lump Sum Price, so estimated cost should be included as a part of the Lump Sum Bid.
2. Also the soils report states possibly lime treatment for 6% at 12". Is this to be priced into the job?
   Answer: No. Just excavation and select backfill.
3. What is the anticipated start date?
   Answer: Approximately 1 month from the bid date (June 17th).

4. Which Geotextile fabric is to be used? C107 states 140N, C109 state impermeable and the Soils report refers to C180N.
   Answer: The 140N geotextile fabric will be used for the project.
5. Plans refer to excavated soils to be removed from the site or stockpiled at the owners chosen location. To price for offhaul trucking, the true location needs to be determined or soils to be removed offsite completely.
   Answer: The location for stockpiled soil will be on an adjacent open area approximately 100 yards away from the Football Field.
6. C101 states a silt fence and DI protection is required and the details on C108 shows the details but no true guidelines are determined for the limits. DI protection is easy to follow. I assume the silt fence would be inside the track if only the base bid is performed and outside if Alternate 3 is chosen.
   Answer: Silt fencing will be used primarily inside the track where the new field construction will be done.
7. Can a substitution for the shock pad be presented? Same material and makeup provided by Regupol.
   Answer: Shock pad installation has been excluded from the project. See revised Specification 03900 in Addendum #2.
8. Is the field currently irrigated?
   Answer: The field is currently irrigated. The contractor will be responsible for removing the existing irrigation lines per Estimated Summary of Quantities listed on Sheet C100. Line item 2 on the reference table states "Removal of Structures and Obstructions (all types)(all depths).

SECTION 03900

DRAINAGE BASE, GEOTEXTILE FILTER FABRIC FLAT PANEL DRAIN AND RECYCLED PLASTIC NAILER BOARD

PART 1

1.01 VERTICAL DRAINAGE BASE MATERIALS

A. Excavation: Existing natural grass field shall be excavated to the depth established as shown on the grading plan. The sub grade shall be shaped to achieve a 0.5% (one half of one percent) slope from the center of the field to each sideline in order to mirror the grade of the finished synthetic turf surface. The sub grade shall also be compacted and proof rolled to a minimum of 95%, in accordance with ASTM D1557 (Modified Proctor procedure).

A. Geotextile Filter Fabric: Non-woven polypropylene geotextile fabric shall be chemically and biologically inert and shall be Mirafi 140N, Mirafi Inc., Pendergrass, GA (888) 795-0808, or approved equal.

B. Drainage Pipe: A network of perforated HDPE highway grade drainage pipe (1" x 12" flat panel pipe) shall be installed under a 6" layer of free draining base aggregate. The drainage pipe will be installed in a herringbone pattern every 25 feet on center and will be connected to 12" perforated diameter perimeter collector lines as shown on drawings.

1. ADS AdvanEdge, 800-821-6710 or approved equal.

    A. 1 inch by 12-inch flat drain.

    B. 12-inch diameter perforated collector drainpipe or approved equal.

2.02 VERTICALLY DRAINING BASE

A. The synthetic turf Base Contractor shall strictly adhere to the installation procedures outlined under this section. Any variance from these requirements must be accepted in writing, by the Field Builder's on-site representative, and submitted to the Architect/Owner, verifying that the changes do not in any way affect the warranty.

B. Install geotextile fabric over excavated and prepared sub-grade in accordance with construction drawings and Field Builder's recommendations. Provide a 12" minimum overlap at all seams. Fabric shall first be installed in the drainage trenches prior to installation of perimeter collector lines. After backfilling of all trenches is

complete, the entire field shall be covered with fabric prior to the base aggregate application.

C. Trenching, Drainage Pipe Installation and Backfilling: All piping shall be as specified and connected as required.

1. The base grade shall be shaped to mirror the finished grade and approved by the Architect and/or Owner's Representative. The Base Contractor shall begin layout and trenching for the drainage network as indicated on the drainage plan and all details that apply. Collector lines shall be installed before lateral lines and shall begin with the deepest elevations. Collector lines shall be connected to discharge outlet at the onset of operations. Trenching progress shall work upward in elevation to allow for immediate discharge of water from the entire field in the event of a rainfall.

2. No trenches, with or without pipe, shall be permitted, to remain unfilled overnight and/or while crews are not progressively working on site.

3. All perimeter trenches must be dug in accordance with the field drainage plan details.

4. After all collector and lateral lines have been installed, the Base Contractor shall repair any sub grade undulations prior to installing geotextile fabric.

D. Concrete Header Curb and Recycled Plastic Nailer: The synthetic turf perimeter fastening structure shall be installed before the drainage aggregate.

1. The 6" x 12" concrete header curb shall be installed in accordance with the Drawings and/or Shop Drawings and these Specifications. The foundation of the concrete header curb shall be a compacted free draining aggregate. Future water entering the foundation shall have a free draining path directly to the perimeter collector pipe.

2. Install a Recycled Plastic 2" x 4" Nailer. Nailer shall be set at the depth as required below top of the curb by means of a Tapcon or ramset every 12 inches. This shall be the responsibility of the Base Contractor. See synthetic turf edge attachment detail on drawings.

E. Base Drainage Aggregate: The installation of the base drainage aggregate shall be installed as shown on the construction drawings and should only begin after the drainage pipe installation has been inspected and approved by Owner's Representative. Installation of the Free Draining Base Aggregate shall follow procedures that protect the base grade soils and drainage pipe. The drainage pipe

network and its existing elevations shall not be disrupted through ground pressures from trucks, dozers or by any other means.

1. The base grade subsoil shall be dry before undertaking the placement of base aggregate.
2. Delivery trucks shall enter the field only from the designated entrance point. Base course stone shall be dumped closest to the entrance first and continuously worked towards the furthest point of the field. Extreme care must be taken not to disturb sub grade or drainage network.
3. Track-type dozers shall push out the stone from behind the pile onto and toward the field center. Dozers shall only traffic the aggregate they are spreading.
4. Bulldozer blades shall be equipped with a laser-guided hydraulic system. Care shall be taken not to disturb or contact the base grade soils with the dozer blades or tracks. All equipment trafficking over the drainage aggregate shall insure there is a minimum depth of 4" of aggregate between the geotextile fabric and the dozer track ground contact position.
5. When the aggregate spreading is completed, the surface shall be further-firmed by a 5-ton roller. Static vibration shall not be part of this process.
6. The stone shall be left firm, but not over-compacted as to protect the porosity and drainage capabilities of the aggregate profile.
7. After the drainage stone has been uniformly spread throughout the surface, the surface shall receive a final laser finished grade. This process shall be accomplished using a turf-type tractor, or lightweight grader, equipped with high flotation tires and a hydraulically controlled laser blade.
8. The free-draining base course must be installed to a depth of 6 inches +/- and shall be independently tested for an overall compaction rate of 95% proctor.

F. Finish Stone Levels: The base drainage stone final elevations shall mirror the proposed finish stone layer final grade material. Care shall be taken not to allow the coarser aggregate to surface into the profile or finished grade of the finish stone layer.

1. It is critically important that the finish stone layer is not laser-graded at more than 0.5" depth. Layers deeper than 0.5" are susceptible to over-compaction and restriction of porosity, leading to drainage issues.

2. The finish stone layer shall be applied using high flotation grading equipment. The finish stone material shall be evenly spread throughout the proposed field surface to the final pre-pad or pre-turf elevations.

3. After the finish stone material has been uniformly spread throughout the surface by the described method, the surface shall receive a final laser finish grade. This process shall be accomplished using a turf-type tractor, or lightweight grader, equipped with high flotation tires and a hydraulically controlled laser blade.

4. Care shall be taken throughout the installation not to force the finish stone material into the porosity of the base aggregate below.

5. Final finish stone layer must be graded by means of a laser within 0 to 1/4 inch from design grade. The finished surface tolerance must not exceed ¼ inch over 10 feet in all directions. Base Contractor must provide a topographical survey with a minimum of 200 shots demonstrating finished grade meets all written requirements.

6. Final layer of stone must be installed at a depth of 2.0 inches. Finished aggregate base must be proof-rolled by means of 2- to 5-ton roller. The finished aggregate base must achieve an overall compaction rate of 95% proctor in accordance with ASTM D1557. It shall also be flush with top of recycled plastic nailer board.

7. The synthetic turf Base Contractor is required to stringline the entire field every five feet to identify high and low spots. And identified high and low spots must be eliminated prior to installation of the synthetic turf.

G. Base Acceptance: The Architect and/or Owner's Representative must jointly approve the base before ShockPad or turf installation can begin.

8. THE CONTRACTOR SHALL MAINTAIN ADEQUATE RECORD KEEPING DOCUMENTING INSPECTION AND REPAIR OF ALL EROSION CONTROL MEASURES INSTALLED.

9. THIS PLAN CONTAINS THE MINIMUM EROSION **CONTROL MEASURES TO BE TAKEN. THE CONTRACTOR SHALL** UTILIZE THE BMP'S OUTLINED IN THE ABOVE **REFERENCED MATERIAL FOR IMPLEMENTATION OF ADDITIONAL** MEASURES, AS REQUIRED.

EROSION AND SEDIMENTATION MANAGEMENT MEASURES:

THE FOLLOWING MANAGEMENT MEASURES SHALL BE IMPLEMENTED DURING CONSTRUCTION TO REDUCE THE POTENTIAL FOR SEDIMENT CONTAMINATION OF DOWNSTREAM WATERWAYS AND CONVEYANCE SYSTEMS, AND TO PRESERVE SURROUNDING FEATURES THAT ARE TO REMAIN UNDISTURBED:

1. **WHERE CONSTRUCTION VEHICULAR ACCESS ROUTES INTERSECT PAVED ROADWAYS, PROVISIONS SHALL BE MADE TO MINIMIZE THE TRANSPORT OF SEDIMENT ONTO THE PAVED SURFACE. WHERE SEDIMENT IS TRANSPORTED ONTO A PUBLIC ROAD SURFACE, THE ROAD SHALL BE CLEANED THOROUGHLY AT THE END OF EACH DAY. SEDIMENT SHALL BE REMOVED FROM THE ROADS BY SHOVELING AND SWEEPING AND TRANSPORTED TO A CONTROLLED SEDIMENT DISPOSAL AREA. STREET WASHING SHALL BE ALLOWED ONLY AFTER** SEDIMENT **IS REMOVED IN** THIS **MANNER**.
2. CONSTRUCTION SHALL BE SEQUENCED SO THAT GRADING OPERATIONS AND STORM DRAINAGE INSTALLATION CAN BEGIN AND END AS QUICKLY AS POSSIBLE.
3. AREAS THAT ARE NOT TO BE DISTURBED SHALL BE CLEARLY MARKED BY FENCING, FLAGS, SIGNS, ETC.
4. DURING CONSTRUCTION, SOIL STOCKPILES SHALL BE STABILIZED OR PROTECTED WITH SEDIMENT TRAPPING MEASURES. THE CONTRACTOR IS RESPONSIBLE FOR THE TEMPORARY PROTECTION AND PERMANENT STABILIZATION OF ALL SOIL STOCKPILES ONSITE, AS WELL AS SOIL INTENTIONALLY TRANSPORTED FROM THE SITE.
5. PERMANENT OR TEMPORARY SOIL STABILIZATION SHALL BE APPLIED TO DENUDED AREAS WITHIN SEVEN (7) DAYS AFTER FINAL GRADE IS REACHED ON ANY PORTION OF THE SITE. TEMPORARY SOIL STABILIZATION SHALL BE APPLIED WITHIN SEVEN (7) DAYS TO DENUDED AREAS THAT MAY NOT BE AT FINAL GRADE BUT WILL REMAIN DORMANT FOR LONGER THAN FOURTEEN (14) DAYS. PERMANENT STABILIZATION SHALL BE APPLIED TO AREAS THAT ARE TO BE LEFT DORMANT FOR MORE THAN ONE (1) YEAR.
6. A PERMANENT VEGETATIVE COVER SHALL BE ESTABLISHED ON DENUDED AREAS NOT OTHERWISE PERMANENTLY STABILIZED. PERMANENT VEGETATION SHALL NOT BE CONSIDERED ESTABLISHED UNTIL A GROUND COVER IS ACHIEVED THAT, IN THE OPINION OF THE ARCHITECT/ENGINEER OR OWNER, IS UNIFORM, MATURE ENOUGH TO SURVIVE, AND WILL INHIBIT EROSION.
7. **CUT AND FILL SLOPES SHALL BE CONSTRUCTED IN A MANNER THAT WILL MINIMIZE EROSION. SLOPES THAT** ARE FOUND TO BE **ERODING EXCESSIVELY WITHIN ONE (1) YEAR OF PERMANENT STABILIZATION** SHALL **BE** PROVIDED WITH **ADDITIONAL SLOPE STABILIZING MEASURES UNTIL THE PROBLEM IS CORRECTED.** CONCENTRATED **RUNOFF SHALL NOT FLOW DOWN CUT OR FILL SLOPES UNLESS CONTAINED WITHIN AN ADEQUATE TEMPORARY OR PERMANENT CHANNEL, FLUME, OR SLOPE DRAIN STRUCTURE.**
8. PERIODIC INSPECTIONS AND REQUIRED MAINTENANCE MUST BE PROVIDED, ESPECIALLY AFTER EACH SIGNIFICANT STORM. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE INSTALLATION AND MAINTENANCE OF ALL EROSION AND SEDIMENT CONTROL PRACTICES.
9. **ADEQUATE DRAINAGE OR OTHER PROTECTION SHALL BE PROVIDED WHENEVER WATER SEEPS FROM A SLOPE FACE.**
